

APPENDIX E

EXISTING VACANT LOTS IN RECORDED SUBDIVISIONS

METHOD OF STORAGE COMPUTATION&EXAMPLE LOT LAYOUTS

Due to the second home nature of many subdivisions in the Tobyhanna Creek Watershed, there are several large subdivisions with many vacant lots where they are not just yet sold, or were bought with a future building date in mind. An analysis was performed to see what impact a total build-out of these lots would have on storm water runoff. It was found that by building on the vacant lots in recorded subdivisions that flows could increase upwards to 134 cubic feet per second for particular subwatersheds. It is therefore advantages, however, not mandatory, to control the runoff from the undeveloped individual lots. A procedure for municipalities to adopt to control this runoff is attached as APPENDIX E of the Model Ordinance.

Should the municipalities not implement the existing vacant lot provisions in Appendix E, then Appendix E shall be excluded from the ordinance.

TABLE 6

STORAGE VOLUME (CUBIC FEET) PER LINEAL FOOT OF STORAGE TRENCH
WITH #3A AGGREGATE OR #4 AGGREGATE

DEPTH OF TRENCH FT.	TRENCH WIDTH (FT.)			
	<u>2</u>	<u>3</u>	<u>4</u>	<u>5</u>
1	0.7	1.1	1.4	1.8
2	1.4	2.1	2.8	3.5
3	2.1	3.2	4.2	5.3
4	2.8	4.2	5.6	7.0
5	3.5	5.3	7.0	8.8
6	4.2	6.3	8.4	10.5
7	4.9	7.4	9.8	12.2

TABLE 7

STORAGE VOLUME (CUBIC FEET) PER LINEAL FOOT OF PERFORATED PIPE

PIPE DIAMETER (IN.)	VOLUME IN CF/FT. OF PIPE
4	0.1
6	0.2
8	0.35
10	0.5
12	0.8
15	1.2
* 18	1.8
24	3.1

STEP 1.

Determine Impervious Surfaces

House Roof 1	.2 X 48 =	576
House Roof 2	12 X 48 =	576
Deck***	12 X 18 =	216
Deck	4 X 24 =	96
Drive	12 X 50 =	600
Garage	12 X 12 =	144
		<u>2,208 S.F.</u>

STEP 2.

Required storage volume from Figure 1 = 505 cubic feet

STEP 3.

Refer to soil log for septic system. Indicates mottling at 48 inches. The percolation rate is 96 minutes/inches. Therefore, from Figure 2, choose seepage trenches for each rain gutter outlet.

STEP 4.

Determine length of trench required - use 6-inch perforated pipe.

<u>GUTTER OUTLET</u>	<u>REQ'D VOL.(C.F.) FROM FIGURE 1</u>	<u>DEPTH OF AGGREGATE FT.</u>	<u>TRENCH WIDTH FT.</u>		
1	118	2	3		
2	118	2	3		
3	30	2	3		
<u>GUTTER OUTLET</u>	<u>VOLUME OF STORAGE PER FT. OF TRENCH*</u>	<u>VOLUME OF STORAGE** PER FT. OF PIPE</u>	<u>TOTAL</u>	<u>TOTAL LENGTH OF TRENCH REQ'D (FT.)</u>	
1	2.1	0.2	2.3	118/2.3 = 51	
2	2.1	0.2	2.3	118/2.3 = 51	
3	2.1	0.2	2.3	30/2.3 = 13	

* From Table 5
 ** From Table 6
 *** Wood decks with spacing between boards are exempt from the calculations.

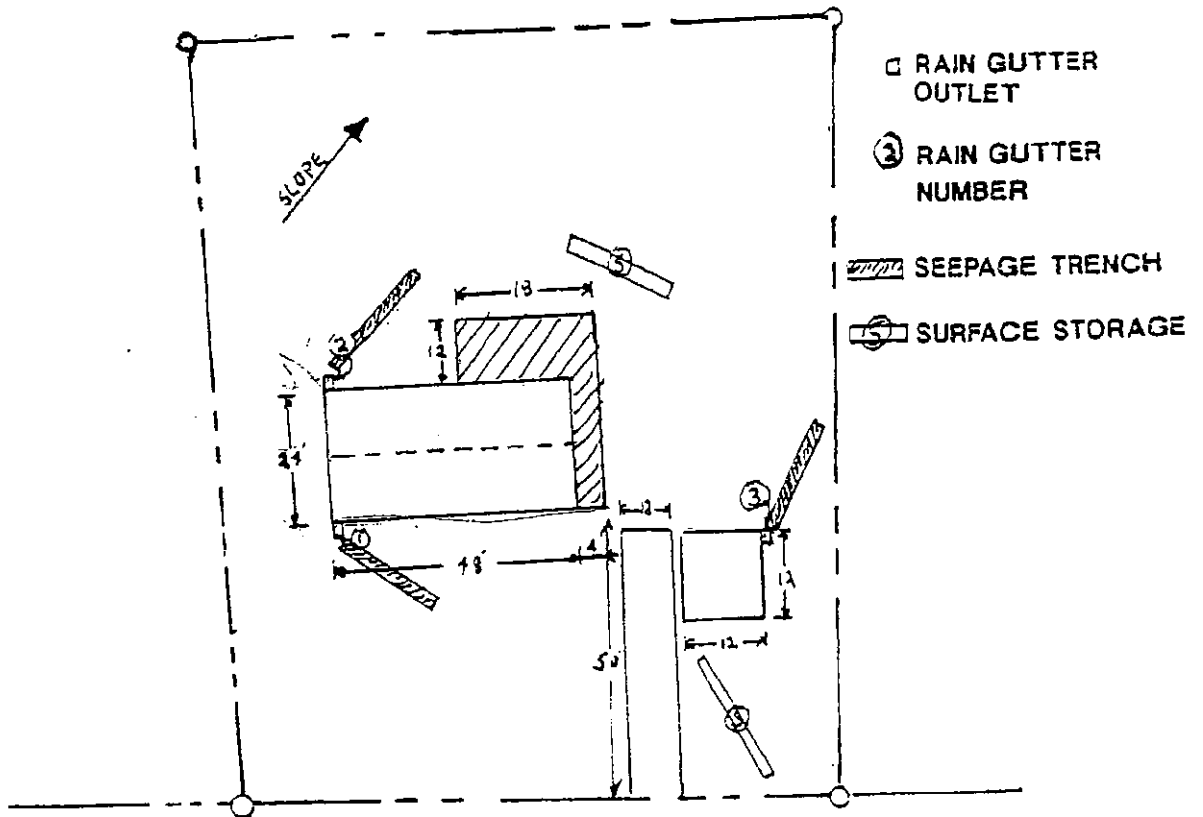

STEP 5.

Determine remainder of impervious surfaces which requires detention and required storage volume from Figure 2.

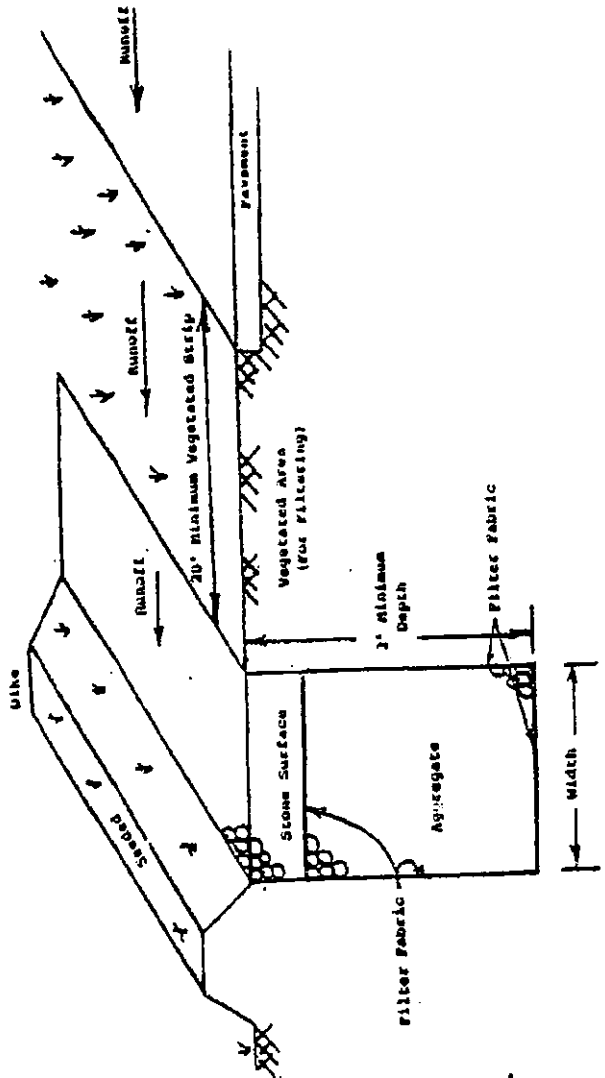

Deck 312 S.F. 912 S.F. = 135 C.F. of Storage
Drive $\frac{600 \text{ S.F.}}{912 \text{ S.F.}}$

Use trench 6' wide by 1' deep x 31 feet long or 2 - 6' x 1' x 16' trenches in locations shown on plan.
